The present study has been carried out in order to determine the clinical and biological aspects of childhood pulmonary tuberculosis in a department in Paris, France, over a ten-year period. All patients with tuberculosis whose age was between 0 and 14 years were retrospectively studied. The case definition was based on clinical, radiological and bacteriological findings. Pulmonary tuberculosis is still a very frequent diagnosis in childhood, especially in the first five years of life. The clinical symptoms are essentially cough and fever and radiological abnormalities may be seen as calcified apical lesions or as bronchial shadows. It is important to diagnose tuberculosis early to avoid complications and to start specific therapy. The fact that more than 50% of the children with tuberculosis have evidence of malnutrition emphasises the need for improved nutritional care of children.Q: Twilio send SMS to non registered number We have used twilio sending SMS to all our registered users from business client account.
